

## 1.8 Demo Contents

Most Viewed Article

**IMPORTANT:** Do not run this procedure on websites that contains already articles and contents, as they will be rewritten. If you have a pre-existing website, create a new site and run the demo setup on the new site, then import your old contents in the new website.

To make your life easier, instead of providing only the .xml, we provide a One Click demo installation plugin.

You can find the demo installation plugin in the product folder, under the **Demo Content Installer** folder

These plugin will setup the entire site as in the demo, except for 2 details:

1. The menu
2. The media contents (which can't be distributed for royalty reasons)

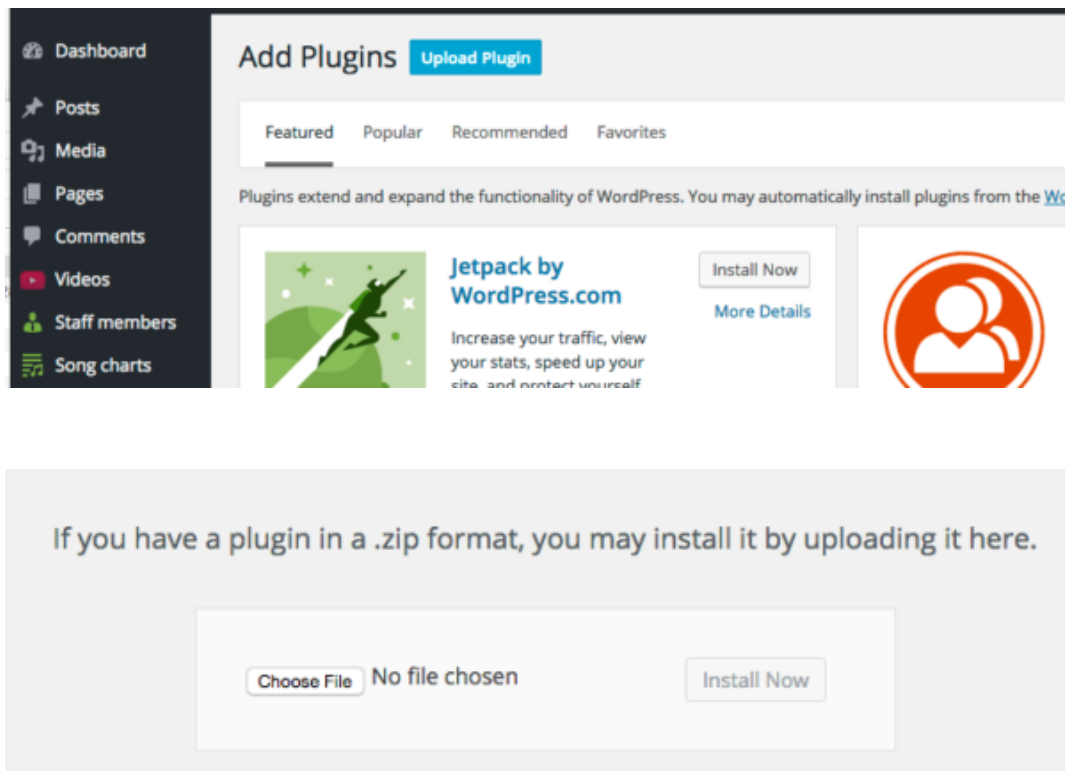

Before proceeding, be sure that you **DON'T HAVE ALREADY INSTALLED the classic WordPress importer plugin**, as it is already **included in the One Click installation plugin**.

Be sure to be using the child theme and not the parent theme in Appearance->Themes:

**Step 1:** To install the demo content, go in

## Plugins -> Install new -> Upload Plugin

**Step 2:** Select the One Click demo installer plugin provided in the product folder

**Step 3:** Install the plugin and activate it.

**Step 4:** Return to the Dashboard

**Step 5:** You will find a new item under Appearance: click **Installer Panel**

**Step 6:** Carefully **READ the instructions you will see there**

### Welcome to One Click Installer

Welcome to One Click Installer, with this you can setup site in matter of minutes. Some Points to note, make sure this is a fresh installation and while installer is running please do not refresh the page. A notification will show after demo has been installed.

**Very important:** be sure to run the installer only once! And be sure to run the installer only on a new empty website, as running it on existing websites can rewrite (delete) pre existing contents and change settings! Demo content cannot be installed in websites with pre-existing contents or your website can be overwritten!

Please also be sure, in case of problems, that your PHP max execution time is at least 600 seconds. In case of problems with the demo contents installation, you need to ask a suggestion to your hosting provider in order to increase your PHP upload and execution limits, and be sure that CURL is enabled.

Run Installer

**Step 7:** Be sure you are not running the installer over pre-existing contents: they will be deleted or modified!

**Step 8:** Click "Run Installer" and wait till a confirmation text appear. Don't run the procedure twice.

**Step 10:** Go in **Appearance->Menu->Manage locations** and set the menus in the proper locations

**All done!**

**Check your website,** all the contents and structure will be there. Of course the images will be replaced with a default image for royalty reasons.

---

**PS. do you want only the xml?** Unzip the plugin, it is inside of the Demo subfolder.
