

1.6 Customizing your website

This theme is customizable using the standard WordPress theme customizer function.

You can access to the customizer visiting Appearance->Customize.

Here you can find all the list of available style customizations. For options not contained in the list, you may need to hire a developer.

The support service doesn't provide CSS, PHP, JS or HTML code customization, as this service is out of the Theme's Support service (such as when you buy a car, adding a new soundsystem is not part of the car assistance service).

Change Image

Here you can change site title, tagline (not used by the theme) and the FavIcon.

Colors customization

This theme is based on a Material Design Framework:

this means that a same color is applied to multiple elements, and sometimes is not possible to assign a specific color to a specific elements without changing other parts of the site.

This is called a color pattern, and this is the standard way Material Design works, to maintain a **harmony** between the elements and provide **a consistent color pattern.**

Be sure to choose high contrast colors between page background and text color. Accent and secondary colors must always be bright colors that can be seen both on black and on white.

The text on primary, accent and secondary colors is always white and can't be changed.

To create **negative** patterns you can choose dark colors for Page and Paper, and a light color for the text.

You can calculate cool color palettes on websites like:

- <http://paletton.com/>
- <https://coolers.co/browser>

If you want to change the color of a specific element independently from the framework, or to change the color of elements not customizable by the customizer, **you may need to add your own custom CSS.**

You can add it in the styles.css file of the Child theme folder in wp-content/themes/sonik-child/styles.css

To edit the CSS file you may also use the function in Appearance->Editor.

Please note that these advanced customizations are generally beyond the normal product support boundaries.

Performance and SEO tips:

To provide the customized colors, the theme adds some custom CSS in the Header of the HTML.

It is not much, but to improve the SEO score of a site, you may want to change this behavior.

To do so, you can proceed as follow:

1. Complete your color and settings customizations in the theme's customizer
 2. Copy the custom styles from the header of the HTML and put it in the styles.css of the child theme
 3. In the functions.php of your child theme, create an empty function called **qantumthemes_css_customizations** which will prevent the theme from outputting the custom CSS.

Show footer widgets

☒

- Footer text: supports HTML basic tags like <a> or

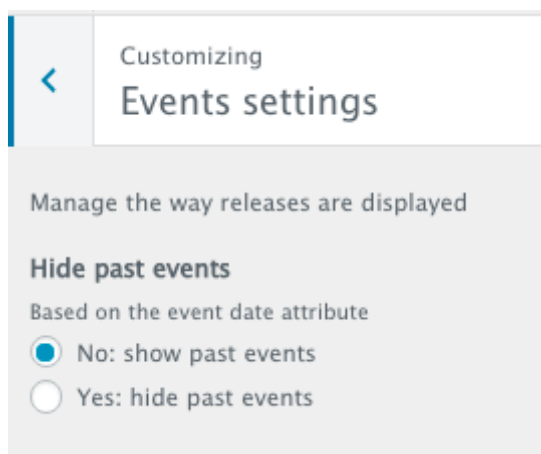

- Widgets background picture
- Footer logo
- Hide/show footer widgets

Radio settings

Here you can generally set the time format on 12 or 24 hours.

Events settings

Events are ordered by event date. To automatically hide the past events you have to set on Yes this option.

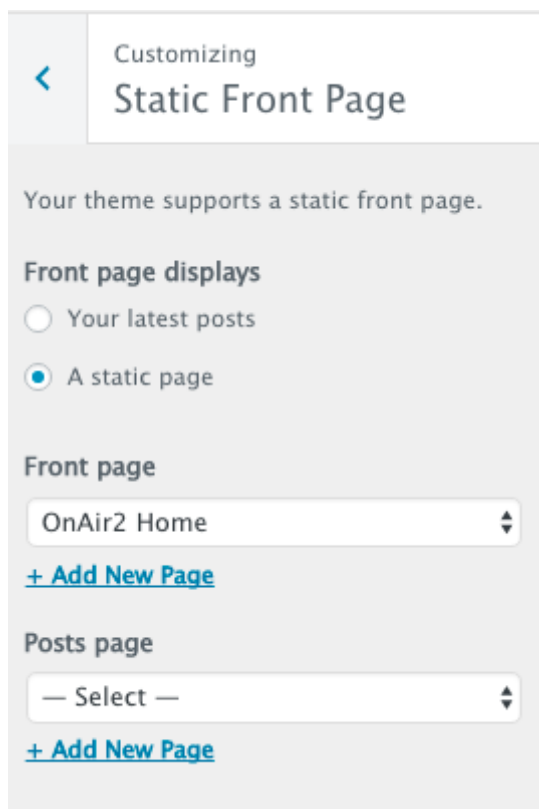

To show separately past and upcoming events, you have to create 2 Event Types and link them separately from the menu.

Widgets

Please always go in Appearance->Widgets to organize the widgets, as from customizer you won't see the sidebars if they are not in your current page.

The footer uses Masonry to diide the widget in columns.

Static front page:

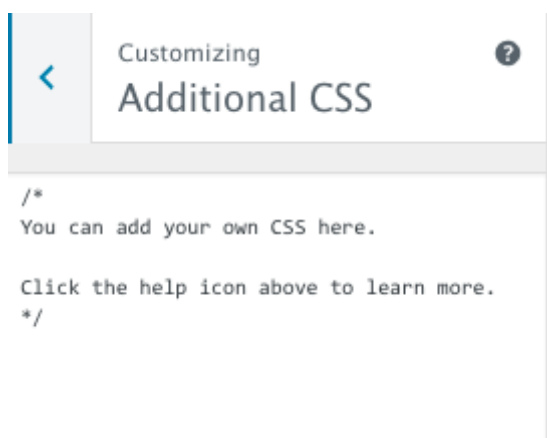

If you set “Latest posts” the index.php template file will be used, which is a one column blog template.

Otherwise you can choose any page from the previously created pages.

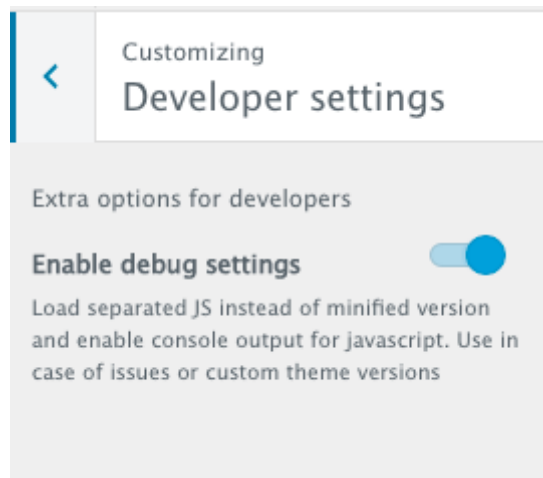

Is not necessary to use a Posts page, as you can create a normal page and choose a specific blog template with more options.

Additional CSS

You can add here your custom CSS. For a better performance, please add it to the styles.css of your child theme by going in Appearance->Editor.

Developer settings

If you are facing javascript issues or you want to load the separate javascript files instead of a unique minified script, enable the developer settings.

This will increase the size of the website for the users and provide a worst performance, so never leave it enabled for production websites.
